

Enterprise Profile

Shandong Haiding Shipbuilding Co.,Ltd.， since established in 1993, it is constantly developing and growing within trials and hardships. In order to attract more industry elites and broaden the business field, The company decide to deeply integrate and reorganize the former enterprise in 2021, And officially registered the present honorable name Haiding. The company is located in Qingzhou City, Shandong Province, China, where is regarded as the “dredger production and manufacturing base” which brings together the wisdom and strength of modular engineering ship manufacturing.

The company occupied an area of 59,400 square meters, including 15,000 square meters of highly standardized factory buildings. The registered capital of the company is 28.5 million yuan and the fixed assets are 80 million yuan. In addition, we have established external partnerships with shipbuildings in coastal and inland areas to ensure convince and efficient production processes for large engineering ship. In terms of personnel allocation, the company has more than 80 employees, including 7 senior ship technicians, 3 quality inspection engineers, dredging research experts, graphic designers, after-sales service technicians and other more than 20 people, with their extraordinary wisdom and unremitting efforts, we created different kind of engineering ship with extraordinary quality. In addition, we also have the professional installation and construction team of more than 40 people, can provide a full range of installation and construction services for global customers.

Our mainly equipment include: steel pre-treatment line, CNC plasma cutting machine, one 100-ton movable gantry crane, four 30-ton overhead cranes, ten 20-ton overhead cranes, and one large test pool. In addition, we are equipped with a full range of cold processing equipment, such as edge milling machines, plate rolling machines, plate shearing machines, pipe bending machines, etc. Meanwhile, we have two car cranes, one each of 50 tons and 25 tons, 12 sets of aerial working platforms, 2 forklifts, and more than 90 other sets of production supporting equipment.

In addition, the company has one large-scale assembling ship platform each in the coastal and riverine areas. Among them, the coastal site is located in Jinghai, Rongcheng City, Shandong Province, where close to the national offshore fishing base on Shawo Island, with a unique geographical location. The site is equipped with a 35,000 tons shipbuilding platform, a 17,000m2 segment fabrication area, and two 25,000 tons and two 10,000 tons mechanical slipways. In addition, there are 28 1,000 tons slips and a 1,500 meters long deep water outfitting wharf with a water depth of 7.2 meters, which can fully meet the needs of construction, assembly and launching of large ships. Various other supporting steel pre-treatment workshops, spraying workshops, shipbuilding and repair facilities and qualifications are all available, providing strong support for the company's shipbuilding business.

The company has a wide range of products, after years of deep developing, has been customized for global customers including 9 series, more than 50 kinds of high-quality products. Among them, the core products include: dredger series (such as cutter suction dredger, bucket wheel dredger, backhoe dredger, jet suction dredger, vacuum jet dredger, drilling dredger, chain bucket dredger, etc., operating platform series (such as offshore lifting platform, cranes operating platforms, piling vessels, etc.), transport ship series (including Tugboat, deck barge, open bottom mud barge, multi-functional working ship, non self-propelled barge, ferry, etc.), floating boat pump station series (providing rocker arm type, positioning pile type, etc.), houseboat series (to create observation boat, cultural and tourism accommodation boat and other characteristic ship), fishing vessel series (covering fishery transportation vessels, ocean squid fishing vessels, purser seiner vessels, low temperature fishing vessels and other diverse fishing vessels), emergency Rescue Series (improved ribbon Bridge, Air-powered Vessel and other emergency equipment), and Barge pontoon Series (Pontoon Wharf, Landscape Pontoon, etc.), and at the same time, we can design and customize the corresponding heterogeneous special engineering vessels according to the customer's special operational needs. These products are widely used in many fields, such as dredging, waterway maintenance, land reclamation, harbor construction, mineral mining, water extraction from lakes and reservoirs, sea and river piling, wind power operation and maintenance, cargo transportation, landscape recreation, fishery fishing, emergency rescue, mooring, etc., which builds up a complete industry chain of engineering ship.

The products of Shandong Haiding Shipbuilding Co.,Ltd., are not only widely praised in the domestic market, but also exported to 132 countries and regions all over the world, such as Russia, the United States, North Korea, Korea, the Philippines, Malaysia, Indonesia, Bangladesh, India, Iran, the United Arab Emirates, Venezuela, Guyana, Chile, Gabon, Ghana, the Democratic Republic of the Congo, Nigeria and so on, crossing the national borders, and have won a wide range of international praises and trusts.The company has been awarded a number of system certifications by the world-renowned classification society, China Classification Society (CCS), including quality system certification, energy management system certification, environmental management system certification and occupational health system certification, as well as the internationally recognized ISO9001 system certification, and has been evaluated as a 3A credit enterprise for enterprise credit evaluation, and the products have been declared as 27 utility model patent certificates and 23 design patents. Patent certificate. These certifications not only highlight our professional strength, but also reflect our strong commitment to quality excellence, energy efficiency, environmental protection and employee health. From design to manufacture, from quality control to the selection of spare parts, we strictly follow the CCS shipbuilding standards and are committed to building the most reliable and high-quality engineering ships.

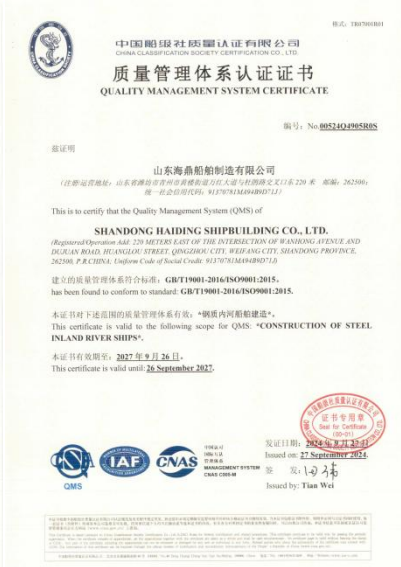

Shandong Haiding Shipbuilding Co.,Ltd., craftsmanship creates trust and connects every corner of the world. Choosing Shandong Haiding Shipbuilding Co.,Ltd.， is choosing quality and trust.Hope we can work hand in hand have a good cooperation.

海鼎船舶
HAIDING SHIPYARD

company profile:

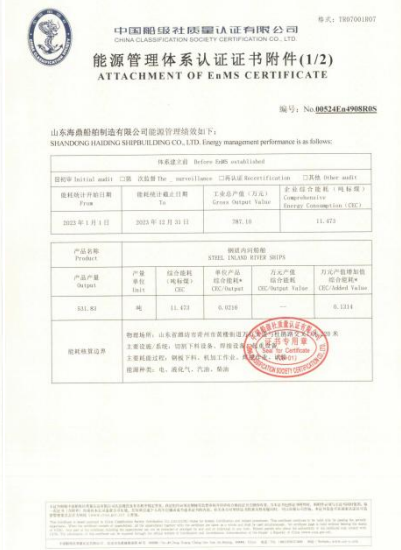

The company has won a number of system certifications from China Classification Society (CCS), a world-renowned classification society, including quality system certification, energy management system certification, environmental management system certification and occupational health system certification, as well as the internationally accepted ISO9001 system certification, and was assessed as a 3A credit enterprise credit evaluation. The product has also declared 27 utility model patent certificates and 23 design patent certificates. These certifications demonstrate not only our professional strength, but also our strong commitment to quality excellence, energy efficiency, environmental protection and employee health. From design to manufacturing, from quality control to parts selection, we strictly follow the ship construction standards of China Classification Society, and are committed to building the most reliable and high-quality engineering ships.

Special port for assembling and launching coastal ships

Cutter Suction Dredger

overview:

The cutter suction dredger is the use of rotating reamer to loosen the soil at the bottom of the river or the seabed, mixing water and sediment into a mud-water mixture, which is sucked into the pump body through the suction pipe and sent to the far end of the mud discharge area through the mud discharge pipe. During the construction of cutter suction dredger, dredging, mud transport and mud unloading are integrated, complete by themselves, and have high production efficiency. It is suitable for dredging inland lakes and coastal ports with small wind waves and low flow rate. It is more suitable for excavation sand, sandy loam, silt and other soil, and can also dig clay after using toothed reamer. The cutter head and other parts of the cutter suction dredger can be divided into hydraulic and mechanical power, of which the hydraulic type has a wider range of application and is more convenient to operate.

advantage:

1. Efficient construction: It realizes the integration of dredging, mud transport and mud unloading, can work continuously for 24 hours, has a low failure rate and only needs 1-3 people to work, which greatly improves the construction efficiency.
2. Strong adaptability: It can carry out dredging work in different waters, and has good excavation and transportation capacity for various soil qualities.
3. Controllable accuracy: It can accurately adjust the digging depth, width and working area through the control system, Beidou positioning or GPS to meet the specific requirements of different working conditions.
4. Convenient transportation: Its structure adopts split assembly design, which can be assembled by car transport to the internal construction waters that are not navigable, and the modular assembly method significantly reduces the transportation cost, greatly reduces the assembly time, and also reduces the use of large machinery.

Bucket Wheel Dredger

overview:

The bucket wheel dredger is a large fully hydraulic operated, modular assembled engineering vessel suitable for dredging hard bottomed waterways, mining and dredging of minerals with high hardness in rivers, lakes and seas. All working equipment on the ship is driven by hydraulic pressure and centrally controlled by PLC. The main body of this ship is composed of multiple floating tanks, which are assembled into one when in use. The cab is detachable and can be lowered when passing through height restricted areas such as bridges. When the engineering ship needs to be transferred to a closed water area without a waterway connection, the hull can be dismantled and transported by car or train.

advantage:

1.Efficient construction: It realizes the integration of dredging, mud transport and mud unloading, can work continuously for 24 hours, has a low failure rate and only needs 1-3 people to work, which greatly improves the construction efficiency.

2.Strong adaptability: It can carry out dredging work in different waters, and has good excavation and transportation capacity for various soil qualities.

3. Controllable accuracy: It can accurately adjust the digging depth, width and working area through the control system, Beidou positioning or GPS to meet the specific requirements of different working conditions.

4. Convenient transportation: its structure adopts split assembly design, which can be assembled by car transport to the internal construction waters that are not navigable, and the modular assembly method greatly reduces the transportation cost, assembly time and the use of large machinery.

Electric Cutter Suction dredger

overview:

Electric cutter suction dredger uses a rotating cutter to loosen the soil at the bottom of a river or sea, mixing water and sediment into a slurry mixture, which is then sucked into the pump body through a suction pipe and sent to the remote discharge area through a discharge pipe. During the construction of a cutter suction dredger, dredging, mud transportation, and unloading are all integrated and completed independently, resulting in high production efficiency. Suitable for dredging in inland lake areas and coastal ports with low wind and waves and low flow rates, it is more suitable for excavating soil such as sand, sandy loam, and silt. After using a toothed cutter, clay can also be excavated. The power of the cutter head and other parts of the cutter suction dredger can be divided into hydraulic and mechanical types, with hydraulic type having a wider range of applications and more convenient operation.

advantage:

1.Efficient construction: It realizes the integrated operation of dredging, mud transportation and unloading, and can work continuously for 24 hours.

2.High reliability: Electric equipment usually has fewer mechanical components and complex transmission systems, reducing the probability of failure.

3.Convenient transportation: Its structure adopts a split assembly design, which can be transported by car to non navigable internal construction waters for assembly.

4.Environmental protection and energy conservation: electric drive, reducing energy consumption, lowering costs, minimal noise pollution, and low failure rate.

Backhoe dredger

overview:

Backhoe dredger is one of the engineering ships used to complete dredging tasks, which is a combination of engineering ships and excavators. The main feature of this type of vessel is that it allows excavators to perform excavation operations on water, the excavation arm can be extended underwater, the bucket will move in the direction of the vessel, and the sediment at the bottom of the river will be removed by the backhoe excavator. These sediments will be moved to transport ships or processed to ensure dredging effect.

advantage:

1.Strong digging ability: capable of digging hard materials underwater, digging materials with a large proportion of river pebbles, and digging at a large depth.

2.Wide applicability: It can operate in different water bodies such as rivers, lakes, and seas, excavating materials such as sand, stone, clay, silt, and other sediments.

3.Good flexibility: occupies a small amount of water, can be self propelled, and has strong mobility.

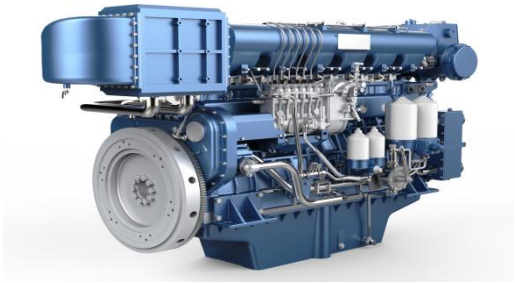

4.High efficiency: able to quickly mine various attribute materials, improving work efficiency.

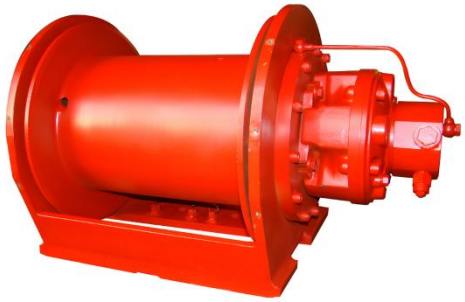

Mountings Selection

Chain Bucket Dredger/Gold Dredger

overview:

Chain bucket dredger is a dredger that uses the chain bucket machine on board to excavate the soil and sand in the subsurface layer of water. Mostly used for sand and gravel mineral mining or dredging harbor basins. Equipped with excavation device, lifting device, large particle filtration device, conveying device, and migration device, the excavated sediment is transported to the transport ship through a conveyor belt, which can complete excavation, sand and stone separation, stone crushing, particle size grading, sediment cleaning and separation, heavy metal extraction, dehydration, and transportation in one go. It has strong adaptability to soil and can excavate various media other than rocks and thick mud. Installing corresponding mineral selection equipment on the ship can upgrade it to a gold mining ship, iron selection ship, salt mining ship, gemstone beneficiation ship, etc.

advantage:

1.Strong adaptability: With strong adaptability to geographical environment and excavated materials, it is an ideal machinery for sand mining in sand fields and rivers. It can also be used for salt mining in lakes, sand and gold selection, sand and iron selection, as well as dredging of nearshore rivers, riverbed excavation, and waterway dredging.

2.Cost effectiveness: Low power consumption, minimal manpower, balanced output, and overall high economic efficiency. This economic advantage gives it a clear advantage in market competition.

3. Convenient maintenance: Reasonable structure, simple operation, and easy maintenance.

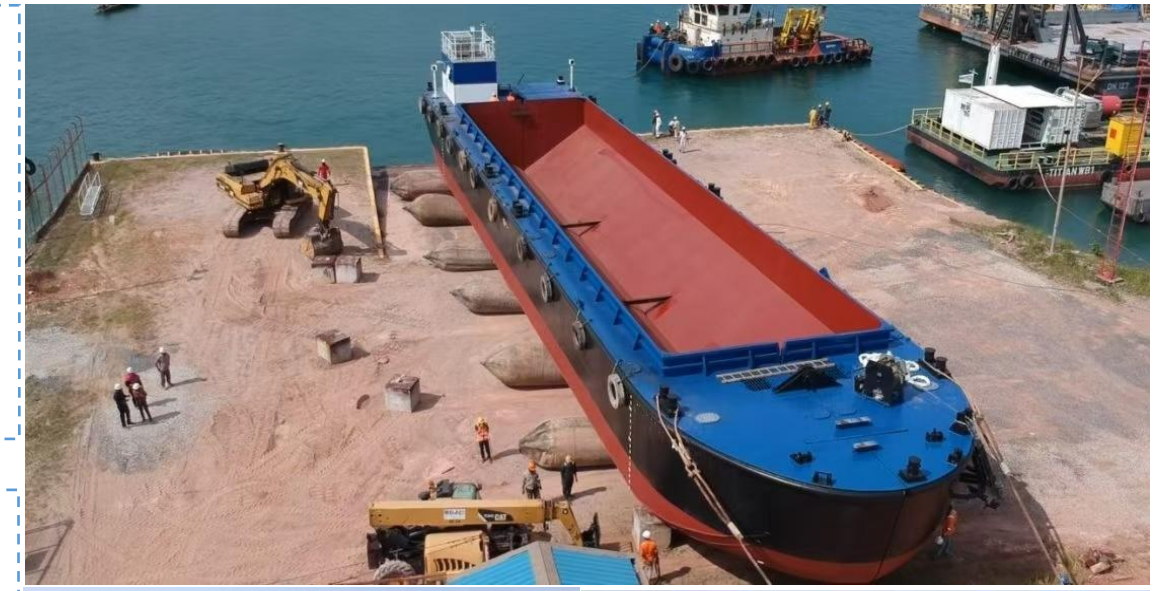

4. High excavation efficiency: The excavation method involves a series of chain buckets running continuously on the drum of the bucket bridge. This design enables the sand dredger to efficiently handle large amounts of sand and soil materials during excavation, with a work efficiency of up to 60-500m ^{3}/hour.

Open Bottom Mud Barge (Split Type Transport Ship)

Open bottom mud barge is a modern and technologically advanced transport and unloading barge. Its uniqueness lies in the fact that it is composed of two precisely symmetrical half hulls on the left and right, which are tightly connected at the head and tail ends through hinge devices. When unloading materials such as soil, stones, or sand, this barge can automatically unfold its two half hulls and flexibly open around the connecting axis. This design makes the unloading speed of the open body mud barge extremely fast, making it the preferred equipment for offshore dumping operations.

advantage:

1.Efficient loading and unloading, the open body mud barge can achieve rapid unloading by opening the hull.

2.Suitable for different work environments, it can be applied in any water area such as rivers, lakes, and seas.

3.Flexible operation, the open body mud barge usually has a small turning radius and can flexibly turn in narrow water areas.

4.Strong transportation capacity, large capacity loading, and good stability.

5.Convenient transportation, modular construction, and assembly for use after transportation by car to enclosed water areas.

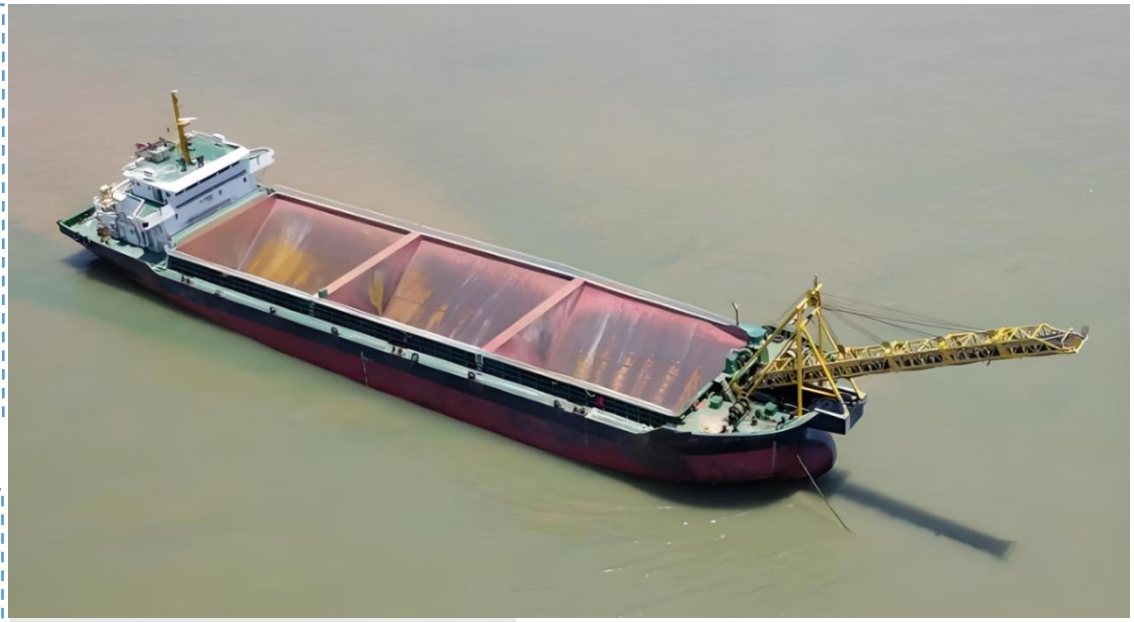

Belt Barge

overview:

Belt Barge are specialized vessels for transporting goods, equipped with large belt conveyor systems that run through the hull and efficiently transport goods. The ship's structure is flexible and can be assembled as a whole or in separate parts for design. Mainly used for transporting bulk materials such as coal, ore, grains, sand and gravel, etc., it achieves rapid loading and unloading and aggregation through a belt system to improve transportation efficiency.

advantage:

1.Equipped with a large belt conveyor system, it has strong self propulsion capability and high transportation efficiency.
2.Convenient loading and unloading, especially for belt transport ships with self dumping function.
3.High cost-effectiveness, which can reduce the transportation cost per unit of goods.
4.Environmental protection and energy conservation, reducing energy consumption, and improving energy utilization efficiency.
5. It can be transported modularly to the place of use, quickly assembled and welded, and put into use in a short time, with strong applicability.

Deck Barge

overview:

A Deck Barge is a barge without cargo hold design, with cargo placed on the deck. The deck is sturdy, supported by pillars and beams to ensure stability. Permanent cargo fence to prevent scattering. But outdoor storage is not suitable for waterproof and moisture-proof goods. The deck space is spacious and suitable for loading various types of goods, such as coal, ore, sand, large equipment, heavy components, etc. Partial deck barges are equipped with cranes to simplify loading and unloading processes and improve operational efficiency.

advantage:

1.It has strong cargo carrying capacity and spacious deck space, which can easily carry a large amount of cargo.

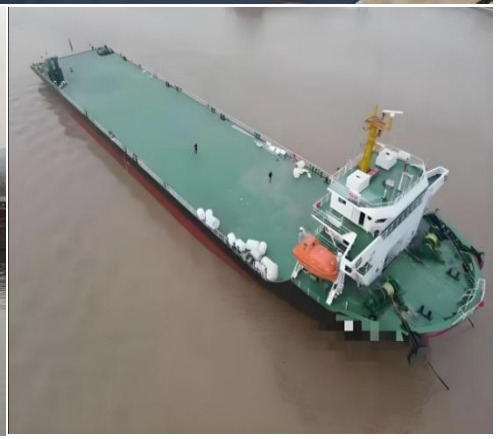

Compared to other large vessels, deck barges have achieved lower cost-effectiveness with their relatively simple construction process.

3.Flexible operation, convenient and efficient loading and unloading process, flexible and diverse route selection to meet different transportation needs.

4.Excellent reliability, the deck barge has a sturdy structure and strong stability, and can maintain excellent cargo navigation performance even in harsh weather conditions.

5.Convenient transportation, modular production, assembly and welding upon arrival at the destination, and rapid deployment for use.

Ferry Boat

overview:

Ferry is a water transportation vehicle that frequently shuttles in specific waters, showcasing its simple and practical charm with its sturdy hull and stable and reliable power system. It mainly serves between the two sides of rivers, lakes, or straits. Whether providing convenient river crossing services for hurried travelers or responsible for transporting vehicles, engineering machinery, and various goods, ferries play a crucial role in short distance water transportation due to their excellent stability and efficient transportation capacity.

advantage:

1.Transportation supplement, especially in certain areas where there is a lack of bridges or where bridge construction is difficult and costly, ferry service has become an important means of transportation supplement.
2.High flexibility, flexible route adjustment, and flexible setting of stops.
3. Strong carrying capacity, ferry can simultaneously carry a large number of personnel, vehicles, and goods.

Jet Suction Dredger

overview:

Jet Suction Dredgers are divided into two types: hard pipe and soft suspended pipe. Both use high-pressure jet water columns on the front end faucet to disperse the ore body. The ship's engine drives the sand suction pump to rotate, sucking the mixed medium into the pump and transporting it through pipelines to the transport ship or onshore sand unloading point. The transportation distance can be selected from 50-2000 meters. Suitable for mining soft or collapsible sand, stone or other material resources without compaction, and does not affect normal mining use when encountering shallow mud layers within 2 meters.

advantage:

1.It has high sand extraction efficiency and can operate continuously for 20 hours, greatly improving work efficiency.

2.The depth of sand extraction is large, ranging from 5-20 meters.

3.Strong environmental adaptability, with excellent extraction ability for sand, gravel, sandy soil, granular dispersed materials or materials prone to collapse.

4. Flexible and convenient operation, easy movement of the hull, and the ability to freely adjust the position in the work area.

5.The console can centrally control the equipment, making it convenient for operators to start, stop, and adjust the equipment. It can also monitor the operating status in real time.

Drilling Dredger

overview:

Drilling Dredger is a type of water sand mining equipment used in special environments. It usually consists of drill pipe support, drill pipe, hull, sand pumping pump, sand pumping pipeline and other parts.Drill pipe supports are used to provide support for drill pipes that are lowered or moved up. The drill bit can vertically break up mud layers of 10 meters or thicker, allowing for direct sand extraction using sand extraction pipelines. Small drilling and sand extraction ships are not equipped with sand storage tanks and can be transported using sand transport ships or sand extraction pipelines.

advantage:

1.Adapt to complex working conditions, have strong ability to penetrate cover layers, and excel in dealing with thick mud layers.

2.The sand pumping depth is large, and currently the maximum pumping depth can reach 110 meters.

3.PLC integrated control system, flexible and convenient operation.

4.Large sand extraction capacity, strong continuous operation ability, and long conveying distance.

5.The economy is relatively good. Compared with some large and complex engineering ships, the structure of drilling sand pumping ships is relatively simple, and the manufacturing and operating costs are relatively low.

6.Convenient transportation, modular production, assembled and welded upon arrival at the destination, and put into use in a short period of time.

Vacuum Jet Dredger

overview:

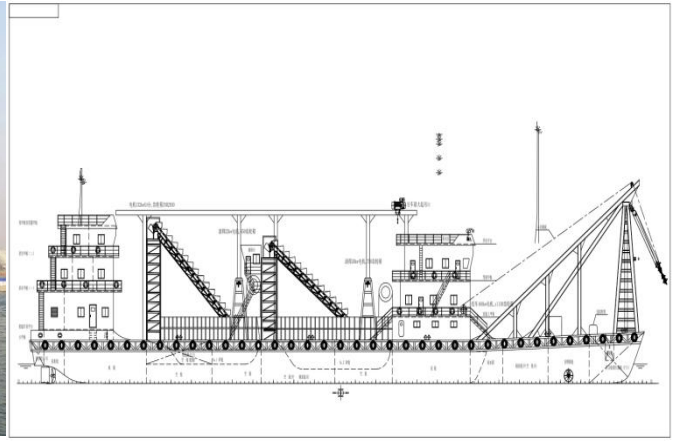

Vacuum Jet Dredger, known as the "sand suction king", is a ship designed specifically for engineering environments. It relies on a powerful sand pump to create a vacuum negative pressure environment inside the sand suction tube, efficiently sucking in the sediment and water mixture from the bottom of the water, and then precisely transporting it to the designated location through the sand discharge tube. The hull structure is mainly made of sturdy steel, ensuring excellent stability and load-bearing capacity, providing a solid foundation for the stable installation of various equipment. As the core power source, the sand pump directly determines the suction efficiency and operational efficiency of the entire ship. Its materials are often wear-resistant and corrosion-resistant to cope with complex, variable, and harsh operating environments. This type of sand pumping vessel plays an indispensable and important role in river dredging, port dredging, lake management, and water conservancy engineering projects.

advantage:

1. Efficient sand pumping, utilizing vacuum suction to quickly remove sediment from the bottom of the water, can operate continuously for 24 hours without interruption.
2. The homework has a large depth and can extract sand and gravel materials at depths of 0-100 meters.
3. Easy to operate, the hull is usually designed to be flexible, making it convenient to move within the work area and adjust the work position.
4. Directly suction into the sand discharge pipeline through vacuum, but the flow pump unit has excellent service life.
5. Convenient transportation, modular production, assembled and welded upon arrival at the destination, and put into use in a short period of time.

Tugboat

概述：

A Tugboat is a ship used to tow barges and ships. The tugboat is characterized by strong structure, good stability, small hull, large main engine power, large traction and good handling performance, but it has no loading and unloading capacity. It mainly tows barges carrying supplies and various working vessels. According to the different areas of use, tugboats can be divided into ocean tugboats, inland tugboats, coastal tugboats, harbor tugboats, Marine rescue tugboats and other types.

优势：

1. Powerful towing ability: large power, wide range of host power, can produce enough traction to help large merchant ships dock accurately in the port. Equipped with professional towing equipment, such as towing machine and towing hook, can effectively control the towing cable, withstand huge tension, to ensure the safety of towing operation.

2. Good maneuverability: small size, small captain and ship width, small turning radius, flexible turning in small Spaces, shuttle in busy ports. The propeller layout is reasonable, such as twin propellers or full rotary thrusters, which can achieve complex maneuvering actions and is used for berthing large ships.

3. Adapt to a variety of working environments and tasks: diverse working environments, can be operated in coastal ports, inland waterways, and can also be used for sea rescue. A variety of tasks, including towing operations, assisting ships to berthing, but also towing special objects, such as oil platforms, floating docks.

Multi-Functional Working Ship

overview:

The Multi-Functional Working Ship , as a vessel dedicated to providing services for other engineering ships, has demonstrated its excellent operational capabilities. It can not only perform towing operations and easily respond to the movement needs of other ships and water facilities, but also assist in the timely transfer of faulty ships to safe areas in emergency situations. In addition, the ship can also be equipped with advanced lifting equipment such as cranes, making tasks such as cargo loading and unloading, equipment lifting, and anchoring easy. The existence of such vessels undoubtedly provides strong guarantees for the safety and smoothness of water transportation.

advantage:

1.High degree of functional integration, a ship can integrate multiple functions, such as towing, anchoring, rescue, commuting, transportation of fuel and daily necessities, etc., reducing the demand for multiple single function ships.

2.Strong flexibility, able to perform tasks in different water environments. Ship design is usually flexible, making it easy to maneuver and dock in various complex operational locations.

3.High safety, with good stability and wind and wave resistance, equipped with complete safety equipment and emergency systems.

4.Convenient transportation, modular production, assembly and welding upon arrival at the destination, and can be put into use in a short period of time.

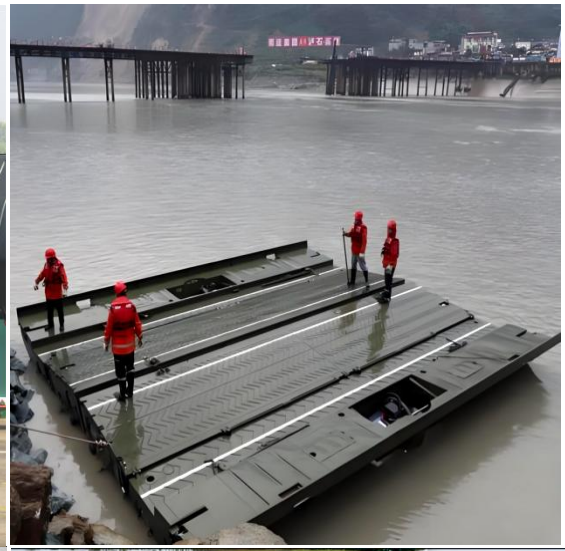

Improved Ribbon Bridge

overview:

Improved Ribbon Bridge is mainly composed of single or multiple boat modules, connecting devices, power systems, and control equipment. The hull module is usually made of high-strength ship plates, which have good buoyancy and load-bearing capacity. According to different requirements, connection devices can be used to connect various boat modules together, forming a stable boat bridge structure. The power system provides power for the driving and operation of the bridge, while the control equipment is used to control the movement and operation of the bridge. In emergency rescue, it can quickly build temporary bridges across rivers, lakes, and other water bodies to transport supplies and rescue personnel, greatly improving rescue efficiency. In engineering construction, emergency pontoon bridges can serve as water-based construction platforms, facilitating bridge construction, river dredging, and other operations.

advantage:

1.Strong maneuverability, able to quickly deploy to the required location by car transportation.

2.Wide adaptability, can be used in different water environments and terrain conditions.

3.With a large carrying capacity, it can meet the transportation needs of large equipment and materials.

4.Easy to operate, personnel who have received professional training can quickly master the operating methods.

5.Diversified functionality, capable of transporting, rescuing, and carrying heavy machinery.

Offshore Lifting Platform

overview:

Offshore Lifting Platform is equipped with lifting pile legs and an optional propulsion system. During operation, the pile legs are inserted or seated into the seabed, and the ship can climb up the pile legs, leave the sea surface, and keep the bottom of the ship a certain distance (air gap) away from the sea surface. It is not affected by the impact of seawater during operation; After the homework is completed, the pile legs are retracted and the ship is in a floating state. The propulsion system equipped on the platform can navigate to the new work area by itself, avoiding towing operations at sea. The platform can carry drilling equipment, heavy-duty cranes, excavation equipment, etc., and is used for bridge, oilfield, wind power installation, scientific research experiments, dredging and excavation, water building installation and other operational purposes.

advantage:

1.High homework stability, stable pile leg support, able to adapt to harsh sea conditions.
2.High homework efficiency, with fast lifting function, can be used in waters ranging from tens of meters to tens of meters deep.
3.Strong flexibility, reusable, large deck space, and efficient lifting capability.
4.High safety performance, good positioning ability and emergency avoidance capability.
5.Convenient transportation, modular production, can be loaded into containers, and can be quickly assembled and put into use in a short period of time.

Rocker Floating Boat Pump Station

overview:

Rocker Floating Boat Pump Station is an intelligent combined floating pump station that integrates water intake pump station and ship design. It is a new type of water supply and drainage system equipment. Compared with traditional fixed pump stations, it is not affected by water level or navigation, does not require cofferdams, has a short construction period, saves investment and is easy to operate and maintain. The water intake floating ship has a humanized design, complete office and living facilities, and an artistic appearance design that can be integrated with tourist attractions. It is the best water intake solution for rivers, lakes, seas and other water bodies, and is also an ideal substitute for traditional fixed pump stations. The water intake floating ship is particularly suitable for scenarios where water level changes are irregular, short-term fluctuations are large, and water level drops are significant.

advantage:

1.The water intake of the rocker arm type floating boat is always kept about 1.5 meters below the water surface, with good water quality and less pollution.

2.The design of the arm type water intake floating ship structure is safe and reliable, ensuring that the pump ship does not sink even if the three compartments are filled with water.

3.The flow rate of the water pump inside the rocker arm water intake floating boat can be adjusted according to the water level, ensuring continuous water supply to the pump boat.

4.The design structure of the rocker arm water intake floating boat water supply pipe system is novel, and the installation and maintenance are convenient and fast.

5.Modular production, convenient transportation, easily accessible by car, and quick assembly for immediate use.

Barge Pontoon

overview:

Barge Pontoon as an unpowered rectangular flat bottomed vessel, a barge is characterized by its wide and flat deck, as well as a hull carefully crafted from sturdy materials such as steel. This type of vessel has a simple design, stable structure, and can ensure stability even when anchored on water for a long time, providing great convenience for vessel docking, passenger boarding and disembarking, and cargo loading and unloading.

The size specifications of barges are flexible and diverse, and can be customized according to specific usage needs to meet the needs of different scenarios. The product types are diverse and abundant, including but not limited to barge docks, official barges, landscape barges, and operation platforms, fully demonstrating their wide application areas and strong practicality.

advantage:

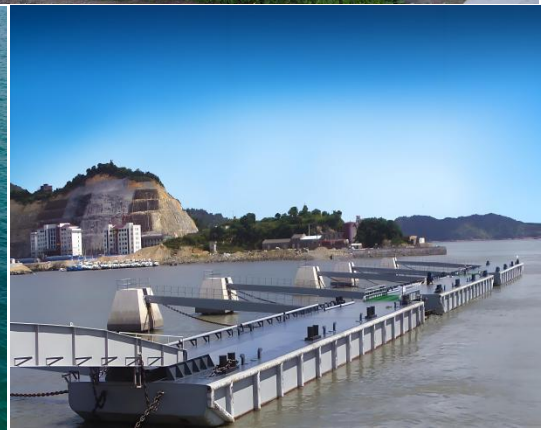

1.Good stability, due to the flat bottom structure and large draft depth of the barge, it has good stability on water.

2.Easy to move, although the barge itself does not have a power device, it can be moved and adjusted in position through tugboats and other means.

3.Low cost, it does not require complex foundation engineering and a large amount of building materials, and can be flexibly designed and modified according to actual situations.

4.It can be produced modularly, transported conveniently, and easily accessible by car. It can be quickly assembled and put into use.

Ocean Fishing Vessel

overview:

Ocean Fishing Vessels refer to vessels engaged in ocean fishing production, which are generally equipped with cold storage processing equipment, fishing equipment, helicopters. The characteristics of ocean-going fishing vessels are far away from the production base, strong independence, and must require light hull, fast speed, automatic net operation, automatic processing, and serialization. With the continuous improvement of the degree of industrial modernization, the level of technical equipment such as horsepower, tonnage, speed, cabin capacity, automation of fishing machinery, comprehensive production capacity, self-maintenance capacity and processing capacity of ocean-going fishing vessels is also constantly improving.

advantage:

1. Access to rich resources: break through the nearshore restrictions, go deep into the ocean to obtain high-value fish.

2. Advanced fishing technology: Equipped with high-precision fish detection equipment (such as sonar) to accurately detect fish, trawl winch and other fishing equipment with a high degree of automation, can accurately control the operation.

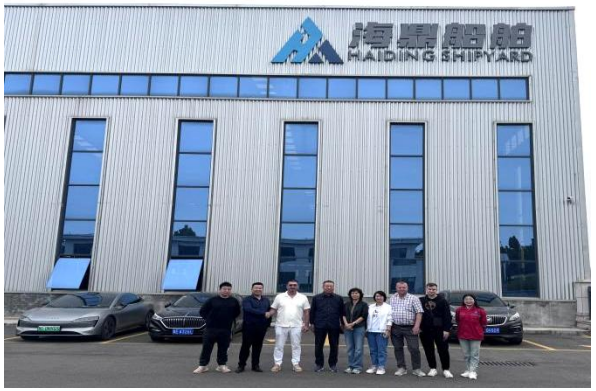

3. Efficient processing and storage: there are perfect processing facilities on board, which can handle the fish in time to ensure the freshness, and the refrigerated storage room can be stored in large quantities, reducing the number of returns to the port and improving the operation efficiency.

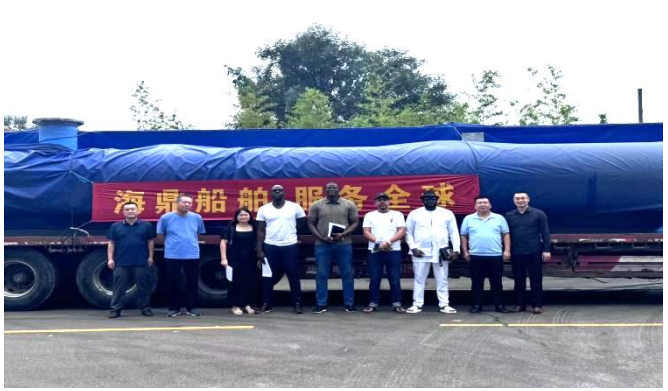

4. Economic income potential: Fishing high-value fish can obtain high returns, and promote the development of industrial chains such as catch processing and trade, creating more income for relevant parties.
